

greenerthumb Requirements

1. Each hardware component must be optional.
2. Sense:
 - a. Air temperature and humidity.
 - b. Soil moisture.
3. Publish sensed data on a connected network.
4. Log sensed data from the network.
5. Plot sensed data from the network.
6. Allow plots to be saved.
7. Remove anomalous data from sensors.
8. Include an option to `bullhorn/subscribe` to automatically reconnect.
9. Embed the icon in the `plot` binary.
10. Don't hide errors in the utility scripts.
11. Add the build directory to the `PATH` in the utility scripts.
12. Emulate sensors if real sensors aren't detected.
13. Provide a log processor.
14. Provide install tools.

Future Requirements

- Sense soil pH.
- Push a notification to a connected phone when the soil moisture from the network is below a user set threshold.
- Water plants when the soil moisture from the network is below the user set threshold.
- Make sensors wireless.
- Provided IC packages for sensors.
- Monitor networks.
- Provide a web interface.
- Discover addresses and ports automatically.
